CampusBridge — Admin Frontend Work Summary

Complete record of the Admin Frontend work completed from project setup through frontend testing

1. Project and Role

Project: CampusBridge — AI-Powered Smart Campus Issue Management System

Role: Admin Frontend Developer

Main responsibility: Build the Admin-side interface for reviewing, assigning, tracking, and managing campus issue tickets.

Important project principle: AI recommends → Human verifies → System tracks.

2. Project Setup

Step	Work completed
1	Created a React/Vite project for the CampusBridge Admin frontend.
2	Project folder created at C:\Users\gokari\Documents\CampusBridge-Admin.
3	Created the Vite React application using the React template.
4	Installed the npm packages and started the development server.
5	Ran the application locally at http://localhost:5173/.
6	Learned to restart the Vite server with npm run dev when the browser showed a connection error.

3. Admin Frontend Development — Starting to Ending

#	Feature / Step	What was done
1	Admin Login	Created the initial Admin Login screen. Later added a frontend-only login/logout flow so the admin can enter and
2	Admin Dashboard	Created the dashboard with ticket statistics and a recent tickets overview.
3	Sidebar Navigation	Added Dashboard, All Tickets, Overdue Tickets, Analytics, and Logout navigation.
4	All Tickets	Created the ticket list using sample frontend ticket data.
5	Sample Tickets	Added CB001 — Projector not working; CB002 — Lab computer problem; CB003 — Classroom fan not working.
6	Ticket Details	Made ticket IDs clickable and created a Ticket Details view showing ticket information.
7	Search	Added ticket search by ticket ID, title, category, and department.
8	Status Management	Added the required status values: NEW, ASSIGNED, IN_PROGRESS, COMPLETED, OVERDUE, REOPENED
9	Assignment	Added staff assignment using IT Support, Maintenance Team, and Electrical Team.
10	Automatic Assignment Status	When a ticket is assigned, its status changes to ASSIGNED.
11	Admin Response	Added an Admin Response text area and Save Response functionality.
12	Due Date	Added due dates to the sample tickets and displayed them in Ticket Details.
13	Overdue Tickets	Created the Overdue Tickets view and included an overdue sample ticket.
14	Search + Filters	Added Status, Priority, Category, and Department filters plus Clear Filters.
15	Status Badges	Added visual status badges to make ticket states easier to recognize.
16	Analytics	Added Total, New, Assigned, In Progress, Completed, Overdue, and Reopened statistics, plus Priority and Depa
17	Admin Login Gate	Added a frontend-only login gate so the Admin Panel is shown after login.
18	Back to All Tickets	Added navigation from Ticket Details back to All Tickets.
19	Correct Selected Ticket	Ticket Details now use the selected ticket instead of always showing one fixed ticket.

#	Feature / Step	What was done
20	Working Status Updates	Status changes update the frontend ticket state.
21	Working Assignment Updates	Assignment changes update the frontend ticket state.
22	Working Admin Response	Admin responses are saved to the frontend ticket state.
23	AI Recommendation Verification	Added editable Verified Category, Verified Department, and Verified Priority fields with Save Verification.
24	Verification Testing	Tested that AI recommendation verification can be saved successfully.
25	Status Testing	Tested status changes, including IN_PROGRESS and COMPLETED.
26	Assignment Testing	Tested assignment and confirmed the ticket becomes ASSIGNED.
27	Admin Response Testing	Tested saving an admin response.
28	Search/Filter Testing	Tested search and Status, Priority, Department, and Category filters, including Clear Filters.
29	Overdue Testing	Tested the Overdue Tickets page and CB002 as the overdue sample ticket.
30	Analytics Testing	Checked dashboard analytics and ticket counts.
31	Login Testing	Tested Logout → Login → Admin Dashboard.
32	Final Frontend Checklist	Checked the major Admin pages and confirmed the Admin Frontend is complete for the current frontend-only sta

4. Current Sample Ticket Data

Ticket	Title	Category	Department	Priority	Status	Due Date
CB001	Projector not working	Projector	IT	HIGH	ASSIGNED	2026-10-10
CB002	Lab computer problem	Computer	IT	MEDIUM	OVERDUE	2026-10-01
CB003	Classroom fan not working	Electrical	Maintenance	LOW	IN_PROGRESS	2026-10-12

5. Final Frontend Features Completed

• Admin Login / Logout

• Admin Dashboard

• All Tickets

• Ticket Search

• Status Filter

• Priority Filter

• Category Filter

• Department Filter

• Clear Filters

• Ticket Details

• AI Recommendation Display

• AI Recommendation Verification

• Ticket Assignment

• Status Management

• Admin Response

• Due Date Display

• Overdue Tickets

• Basic Analytics

• Frontend state updates for status, assignment, verification, and response

6. What Is NOT Connected Yet

The current Admin Frontend uses sample frontend data. It is not yet connected to the team's real Firebase Authentication or Firestore database. The final project also needs integration with the AI recommendation work and the shared ticket/data contract used by the team.

This means the Admin Frontend portion is complete for the current frontend-only stage, but the complete CampusBridge system still requires team integration, Firebase connection, AI integration, final testing, and deployment.

7. Important Project Rules Followed

• Used the required final status names: NEW, ASSIGNED, IN_PROGRESS, COMPLETED, OVERDUE, REOPENED.

• Did not use RESOLVED as a final status.

• Did not build a separate Firebase/database for the Admin frontend.

• Did not build a separate AI model.

• Kept the work focused on the Admin Frontend responsibility.

• Built the MVP/frontend first using sample data before Firebase integration.

• Kept AI recommendations editable/verified by a human.

8. Next Work After Frontend Completion

• Coordinate with the Firebase/database teammate for the common Firestore ticket structure.

• Connect Admin Login to the team's Firebase Authentication when the integration is ready.

• Replace sample ticket data with Firestore ticket data.

• Connect assignment, status, admin response, verification, and due-date updates to the shared database.

• Connect the AI recommendation fields supplied by the AI team.

• Perform final integration testing with the complete team.

• Prepare the final deployment/documentation.

Summary: The Admin Frontend has been built and tested from project setup through the complete frontend-only MVP. The next stage is integration with the team's Firebase and AI components.
